## FAIR SHARE HOUSING MODEL FOR CONNECTICUT, 2020

November 2020

Prepared for and in collaboration with:

Open Communities Alliance  
76 Charter Oak Avenue, Suite 1-200  
Hartford, CT 06106

Prepared by:

David N. Kinsey, PhD, FAICP

[Page intentionally blank]

## EXECUTIVE SUMMARY

Connecticut needs more and more diverse affordable housing throughout the state in all kinds of towns, particularly those that have not yet provided significant opportunities for housing choice and multifamily dwellings, as required by state law.

To address these needs, the Open Communities Alliance has prepared a 14-step fair share model that assesses regional housing need in Connecticut today (2020) and allocates that need fairly to each region's towns. The long-established regions of Connecticut's nine regional councils of government serve as the Housing Regions for this fair share model.

Recognizing that the state's affordable housing needs have accumulated over decades, and cannot reasonably be satisfied in even one decade, the Open Communities Alliance model intentionally adopts a narrow definition of Current Need of 137,754 affordable housing units, which is only 36% of Connecticut's 380,000 lower income households who currently spend more than 30% of their income for housing.

This model then allocates this Regional Current Need (Fair Share) to each Housing Region's towns based on differences in ratables, household income, poverty, and multifamily housing among the towns. Next, the model screens, pools, and reallocates the Gross Fair Shares initially allocated to High Poverty towns, and incorporates a Transition Adjustment Factor that recognizes that the need for affordable housing has accumulated over decades and cannot be remedied overnight. Finally, the model then calculates the allocated and, in some cases, adjusted Fair Share for each town, for a statewide total of 121,085 affordable housing units as of 2020. Appendix A presents the Fair Share for each of the 169 towns in Connecticut, both by Housing Region and alphabetically.

This report explains in detail the steps and data used in the fair share model to make these calculations.

## APPENDIX A: Fair Share Housing Allocations by Town, 2020 (alphabetically and by Housing Region)

## INTRODUCTION

Prepared for and in collaboration with the Open Communities Alliance (“OCA”), this report presents a methodology for assessing and allocating fairly the current need for affordable housing in Connecticut by lower income families and individuals. This report begins by defining several key terms and providing some context on housing needs in Connecticut. Next, the scope and focus of this methodology are explained, followed by an articulation of the principles that have guided the preparation of this methodology.

The core of this report is a step-by-step presentation in 14 steps of this fair share model (“model”) and its calculations, both regional assessments of current affordable housing need, resulting in a statewide Current Need of 137,754 housing units, and allocations of Regional Current Need (Fair Share) to each Housing Region’s towns. An Excel workbook, available at this [link \[https://www.ctoca.org/fairshare\]](https://www.ctoca.org/fairshare), constitutes the fair share model and its data, algorithms, calculations, results, and data sources. Appendix A presents the calculated Allocated Fair Share, i.e., number of needed affordable housing units, for each of the 169 towns in Connecticut.

Finally, the need for affordable housing in Connecticut’s towns and regions has accumulated over decades. Consequently, the Model includes a Transition Adjustment Factor. As applied, the statewide total adjusted Fair Share is 121,085 affordable housing units.

## DEFINITIONS

“Affordable housing” means, for this methodology and report, income-restricted, safe, decent housing sold or rented such that the cost of housing for a very low income or a low-income household is less than 30% of gross household income, adjusted for household size.

“Cost-burdened” means a household spends more than 30% of its income on housing. A household that spends more than 50% of its income on housing is considered “severely cost-burdened.” These households have less disposable income to spend on food, transportation, health care, clothing, and other essentials of daily life.

“Low-income household” means a household whose income is more than 50% and less than 80% of the HUD Adjusted Median Family Income (“HAMFI”),<sup>1</sup> as defined and calculated annually by the U.S. Department of Housing and Urban Development (“HUD”) by HUD Metro Fair Market Rent Area (“HMFA”)<sup>2</sup> throughout the United States for its Section 8 (Housing Opportunity Voucher) Income Limits program.

“Very-low income household” means a household whose income is 50% or less than the HAMFI.

“Extremely low-income household” means a household whose income is 30% or less than the HAMFI.

“Lower income household” means a household whose income is less than 80% of the HAMFI, i.e., includes both extremely low- and very low-income households.

---

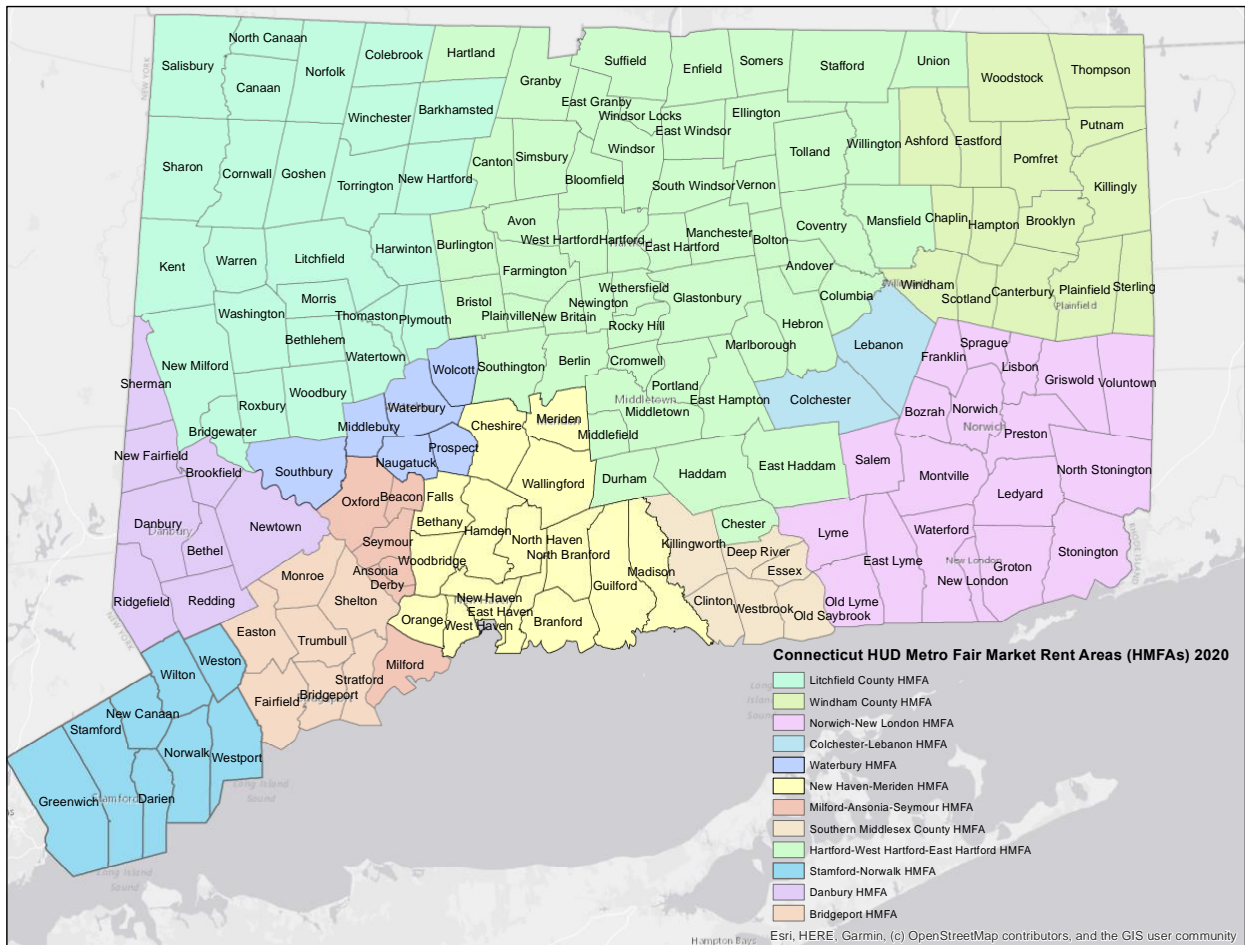

<sup>1</sup> For HUD’s step-by-step explanation of how it calculates median family income, see “Median Family Income Calculation,” <https://www.huduser.gov/portal/datasets/il/il2019/2019MedCalc.odn> For HUD’s explanations of how it calculates income limits by category or tier, see the HUD explanations for extremely low income, very low income, and low income in its FY 2020 Income Limits Documentation System, <https://www.huduser.gov/portal/datasets/il/il2019/2019summary.odn> <accessed April 23, 2020>

<sup>2</sup> HUD cautions that its HMFAs “are not comparable to any standard Census geography” used by the U.S. Census Bureau. In New England, HUD bases its HMFAs on towns, while elsewhere in the United States these areas are based on Metropolitan Areas and nonmetropolitan counties defined by the Office of Managements and Budget. “HUD Metropolitan Fair Market Rent Areas,” [https://www.huduser.gov/portal/datasets/il/il2019/area\\_definitions.odn?systype=IL&year=2020&wherefrom=geo](https://www.huduser.gov/portal/datasets/il/il2019/area_definitions.odn?systype=IL&year=2020&wherefrom=geo) <accessed February 5, 2020>

For Connecticut, HUD annually calculates separate sets of median family incomes and income limits for 12 different regions of the state, known as HUD Metro Fair Market Rent Areas (“HMFAs”), using HUD’s geographic area definitions for determining Fair Market Rent (“FMR”), as shown in Figure 1.

Figure 1: Map of Connecticut HUD Metro Fair Market Rent Areas (HMFAs)

Source: HUD Web site, <https://www.huduser.gov/portal/datasets/mtsp/mtsp20/area-definitions.pdf>, <accessed September 14, 2020>

HUD calculates a median family income for a four-person family for each of these areas, making certain adjustments, and then adjusts income limits for family size and percentage of adjusted median family income.<sup>3 4</sup>

HUD uses these regional income limits to determine the eligibility of applicants for its assisted and public housing programs. Connecticut and other states use these HUD income limits to administer their affordable housing programs. Income eligibility for more than eight million assisted affordable housing units across the United States is determined using these HUD income limits.<sup>5</sup> Each year the Connecticut State Department of Housing (“DOH”) prepares and posts a table with “DOH Development Program Limits based on the HUD Median Incomes” for the 12 HMFAs using the HUD income limits for 11 different tiers of income limits used in several housing programs, including the three tiers calculated by HUD: extremely low-income, very low-income, and low income.<sup>6</sup>

---

<sup>3</sup> For an example of the adjustments, for its FY 2020 Income Limits, HUD began this calculation with a special tabulation by the U. S. Census Bureau of estimates for median family income from the 2013-2017 5-Year American Community Survey (“ACS”), Table B19113, but used 2017 1-Year ACS estimates that were available and deemed reliable before adding a Consumer Price Index (“CPI”) inflation factor and rounding to the nearest \$100. The lower income limit is 80% of the resulting HAMFI. HUD also calculates the income limits in three categories – extremely low, very low, and low – with adjustments by eight family sizes. HUD’s annual Income Limits Documentation System provides these limits for every HMFA.

<sup>4</sup> To review the calculations of the HAMFI for any HUD FMR Metro Area, see the HUD Web site and in the drop-down windows chose a state and then choose a county or town. Buttons on the Web page marked “Explanation” lead to detailed explanations of the calculations each year of income limits.

<https://www.huduser.gov/portal/datasets/il/il2020/2020summary.odn> <accessed April 29, 2020>

<sup>5</sup> The affordable housing supply of the United States subject to HUD-based income limits currently (2020) includes: (a) 3.13 million units financed through Low Income Housing Tax Credits, (b) 2.2 million federal Housing Opportunity Vouchers, (c) 1.3 million public housing units, (d) 1.0 million Project-Based Section 8 housing units, (e) about 360,000 HOME-funded units, and (f) about 356,000 Section 202 (senior) and Section 811 (disability) units, plus additional units funded by state programs and private sector inclusionary developments.

<sup>6</sup> Connecticut State Department of Housing, DOH Development Program Income Limits Based on HUD Median Income, (Revised 9/16/2020) <https://portal.ct.gov/DOH/DOH/Additional-program-pages/HUD-Rent-and-Income-Limits> <accessed October 20, 2020>

These income categories are often referred to in terms of percentage of area median income (“AMI”), e.g., that low-income means less than 80% of AMI. However, it is important to note that the HUD median family incomes, and resulting income limits, are not mathematically correct medians, due to the adjustments that HUD makes to the sample data on median family incomes it obtains annually as special tabulations from the U.S. Census Bureau.<sup>7</sup> Also, it is important that the “area” in “area median income” be specified, as various geographic definitions are possible. Finally, while the HUD income limits are based on “family” median income data, they are applied as well to households in calculating housing need and determining income eligibility for assisted housing. Under U.S. Census Bureau definitions, all families are households, but not all households are families. While the U.S. Census Bureau defines a “family” as two or more related persons living together, HUD calculates income limits as well for a one-person “family,” which by U.S. Census Bureau definition is considered a “household.”<sup>8</sup> For that reason, this fair share methodology refers to households.

---

<sup>7</sup> See the annually updated HUD general explanation of its income limits methodology, “Methodology for Determining Section 8 Income Limits,”

<https://www.huduser.gov/portal/datasets/il/il20/IncomeLimitsMethodology-FY20.pdf>

HUD explains in a FAQ the reason low income limits do not equal 80% of median income: “There are many exceptions to the arithmetic calculation of income limits. These include adjustments for high housing cost relative to income, the application of state nonmetropolitan income limits in low-income areas, and national maximums in high-income areas.” [https://www.huduser.gov/portal/datasets/il.html - 2020\\_faq](https://www.huduser.gov/portal/datasets/il.html - 2020_faq) <accessed April 23, 2020>

Prepared by David N. Kinsey, PhD, FAICP, May 13, 2020

By definition, all households in the smallest column in this graph, 376,850 existing lower income, cost-burdened households living in Connecticut, are income-eligible for affordable housing. Connecticut’s current supply of about 170,000 affordable housing units is important, but by the standard federal metric the “need” is more than twice the existing supply.

## SCOPE

This fair share model quantifies recommended municipal responsibility for creating realistic opportunities for affordable housing, defined as a fair share of the Regional Current Need for affordable housing, fairly allocated to all towns in a region. The model has two discrete components: first, defining and calculating the Regional Current Need for affordable housing, and, second, allocating fairly Regional Current Need to each region's towns.

The model's definition of "affordable housing need" is intentionally substantially less than the current "need," on a cost basis, for affordable housing by the estimated 376,850 lower income, cost-burdened households currently living in Connecticut. The model identifies the number of existing extremely low-income households (household income <30% HAMFI) by region who are severely cost-burdened (spend >50% of income for housing costs). HUD's most recent statewide estimate, released in late 2019, is that Connecticut currently has 135,740 households that meet these two criteria: (a) extreme low-income and (b) severe cost-burden, as shown in Figure 3.<sup>28</sup> As defined, housing need is referred to as "Current Need" as of 2020 for the purpose of this fair share methodology.<sup>29</sup> While the 135,740 households in this category are merely 36% of Connecticut's 376,850 cost-burdened lower income households, which is arguably the full population in need of affordable housing, it nevertheless is a substantial, 10% of Connecticut's total households, according to HUD's most recent data, as shown in Figure 3.

---

<sup>28</sup> The statewide total calculated by HUD is 135,740 households, but the aggregate of HUD's calculations by town is 137,754 households, as calculated by this fair share model., see Figure 6.

<sup>29</sup> The year "2020" is used in this methodology to describe Current Need for two reasons. First, the methodology was prepared in 2020, so the "current" time is 2020. Second, the best available data is the HUD CHAS data released in 2019, although based on 2012-2016 ACS estimates, which is close to 2020.

Figure 3: Connecticut Housing Need, 2016

Connecticut Housing Need (based on HUD CHAS data for 2012-2016 released August 2019)				
Income Tier	% of HAMFI	Total	Cost Burden (>30%)	Severe Cost Burden (>50%)
Total Households	100%	1,354,715	474,040	220,685
Lower Income Households	<80%	570,270	376,850	208,130
Low Income Households	>50% to <80%	183,600	82,910	20,120
Very Low Income Households	>30% to <50%	171,925	126,445	52,270
Extremely Low Income Households	<30%	214,745	167,495	135,740
Notes:				
1. "HAMFI" = HUD Adjusted Median Family Income				
2. The data in this table are derived from statewide estimates by HUD. The total estimated extremely low income households with severe cost burden is 2,014 fewer than the aggregate total of 137,754 households of the HUD estimates by town, reported in Figure 6				
Source: HUD, Consolidated Planning/CHAS Statewide Data for 2012-2016, released August 5, 2019, <a href="https://www.huduser.gov/portal/datasets/cp.html">https://www.huduser.gov/portal/datasets/cp.html</a> <accessed November 6, 2019>				
Prepared by David N. Kinsey, PhD, FAICP, August 20, 2020				

Figure 4 displays the relationship between Connecticut’s total households, households income-qualified for affordable housing, and the intentionally narrower definition of Current Need in this methodology, i.e., extremely low income households with severe cost-burden.

Figure 4: Connecticut Households and Current Need, 2020

Note: This chart is based on HUD CHAS data derived from the 2012-2016 ACS, 5-Year released in late 2019 by HUD. Source: US HUD, Consolidated Planning/CHAS Data, <https://www.huduser.gov/portal/datasets/cp.html> <accessed Nov. 6, 2019> Prepared by David N. Kinsey, PhD, FAICP, August 20, 2020

Current Need is calculated by Housing Region in this model and then allocated fairly to each Housing Region's towns as its Fair Share. Affordable housing need is defined in terms of households, because households occupy housing units by U.S. Census Bureau definitions.

While affordable housing need in Connecticut is dire and significant by several metrics (see Figures 2, 3, and 4 above), these needs have accumulated over decades. Consequently,

this initiative does not attempt to quantify and allocate responsibility for all of Connecticut's affordable housing needs.<sup>30</sup>

This intentional undercount also recognizes the capacity and record of the home building industry in Connecticut, as evidenced by trends over the past two decades in issuance of housing construction permits, approximately 6,700 permits for housing units per year statewide over 2000-2019 but only 4,500 permits per year more recently during 2010-2019.<sup>31 32</sup> This intentional undercount also recognizes the scale of financial subsidies available for affordable housing construction. For example, in the 2019 annual cycle, the Connecticut Housing Finance Authority awarded highly-competitive 9% Low Income Housing Tax Credits for the construction of only 348 affordable housing units and State Housing Tax Credit Contributions (HTCCs) to non-profit developers to finance the construction of only 596 affordable housing units.<sup>33</sup>

Nor does this methodology attempt to project the distribution of newly forming lower income households by age group or expected housing tenure (renters or owners) that will need housing in the future,<sup>34</sup> or assess and allocate the number of housing units needed by region for all income categories in the future.<sup>35</sup>

---

<sup>30</sup> This initiative also does not attempt to calculate or estimate the number of lower income households living in substandard housing in need of rehabilitation, the homeless, or persons in need of supportive or special needs housing, such as the disabled, victims of domestic violence, or veterans. If income-eligible, all of these special needs populations would qualify for affordable housing.

<sup>31</sup> Analysis of annual and monthly building permit data for 2000-2019 available from the CT Department of Economic and Community Development, "Housing & Income Data" website, [https://portal.ct.gov/DECD/Content/About\\_DECD/Research-and-Publications/01\\_Access-Research/Exports-and-Housing-and-Income-Data](https://portal.ct.gov/DECD/Content/About_DECD/Research-and-Publications/01_Access-Research/Exports-and-Housing-and-Income-Data) <accessed June 17, 2020>

<sup>32</sup> Local land use regulation and limited developable land zoned for multifamily housing have also no doubt affected the record of housing construction during 2000-2019.

<sup>33</sup> Connecticut Housing Finance Authority, "2019 Summary Report," pp. 29-31, [https://www.chfa.org/assets/1/6/2019\\_Summary\\_Report.pdf](https://www.chfa.org/assets/1/6/2019_Summary_Report.pdf) <accessed August 19, 2020>

<sup>34</sup> SCCOG and SECHA did recently prepare a regional housing needs assessment for Southeast CT RCOG region that did project household growth and housing demand, by age groups and tenure as of 2030; see SCCOG & SECHA *Southeastern Connecticut Housing Needs Assessment*, 2018, [http://seccog.org/wp-content/uploads/2018/05/2018\\_Housing\\_Needs\\_Assessment\\_03162018.pdf](http://seccog.org/wp-content/uploads/2018/05/2018_Housing_Needs_Assessment_03162018.pdf) <accessed April 27, 2020>

<sup>35</sup> This methodology is much more limited in scope than the California Regional Housing Needs Allocation ("RHNA") system, in which the state calculates future population growth and needed housing at all income levels for more than 20 regions whose regional planning agencies in turn then assign each local government

Instead, this fair share methodology adopts a well-defined portion of current affordable housing need as a proxy for these diverse housing needs, referred to as Current Need. Creating affordable housing opportunities for the needs identified and allocated in this initiative will go a long way towards meeting the state's overall housing needs.

---

in their regions its allocation of housing need for which the local government must zone to accommodate its share of the regional need established by the state. See California Department of Housing and Community Development, "Regional Housing Needs Allocation and Housing Elements," Website, <https://www.hcd.ca.gov/community-development/housing-element/index.shtml> <accessed May 13, 2020>

## GUIDING PRINCIPLES FOR THE FAIR SHARE HOUSING MODEL

Several principles have guided the development of this fair share housing model and its methodology:

- Make the model transparent and accessible as to data, data sources, algorithms, formulae, and calculations
- Use the best available, most up-to-date, and reliable data
- Use only publicly available data from the U.S. Census Bureau, U.S. Department of Housing and Urban Development, and the State of Connecticut
- Use consistent data sets, to the maximum extent practicable
- Use consistent time periods for start dates and end dates, to the extent feasible
- Make the model as simple and straightforward as possible
- Make the model as accurate as possible, given the limitations of the available data

## METHODOLOGY FOR THE FAIR SHARE MODEL

### PHASE ONE: ASSESS HOUSING NEEDS OF HOUSING REGIONS

#### **Step 1: Identify Housing Regions**

Connecticut's 169 municipalities (towns and cities) and their surrounding areas have considerable socioeconomic, demographic, and racial/ethnic diversity. For example, while the statewide median household income was \$76,106 in 2018, the median municipal household income ranged from a low of \$34,338 in Hartford to a high of \$219,083 in Weston.<sup>36</sup> Given this diversity, it is reasonable and appropriate to divide the state into regions that generally share some economic characteristics for the purpose of assessing housing needs, otherwise housing that might be deemed affordable in one part of the state would not be affordable elsewhere. For example, while in 2018 the median household in Weston could afford a monthly housing cost of \$5,477, the statewide median household could afford a monthly cost of \$1,903, and the median household in Hartford could afford only a monthly housing cost of \$858, without being cost-burdened.<sup>37</sup>

Several kinds of regions have been delineated in Connecticut for different reasons, encompassing different combinations of the state's 169 municipalities, including:

- Nine "planning regions" for regional councils of government ("RCOGs"), which comprise from six to 38 towns<sup>38</sup>
- Eleven HUD Metro FMR Areas ("HMFA"), grouping from two to 51 municipalities, for which HUD annually calculates median family incomes and sets the income

---

<sup>36</sup> U.S. Census Bureau, 2018 American Community Survey, 5-Year Estimate, Table B19013. [Connecticut Data Collaborative](#) <accessed April 21, 2020>

<sup>37</sup> The calculations cap monthly housing cost at 30% of income.

<sup>38</sup> State of Connecticut, Office of Policy and Management, [Regional Councils of Government \(RCOGs\) in Connecticut](#). <accessed March 4, 2020> Originally, Connecticut had 15 RCOGs, but in 2014 the Office of Policy and Management completed a comprehensive "analysis of the boundaries of local planning regions" that resulted in some consolidation and realignment of the boundaries into nine planning regions. The analysis considered many relevant factors, including economic regions, economic development districts, labor market areas, natural boundaries, relationships between urban, suburban and rural areas, census and other demographic data, political boundaries, transportation corridors, metropolitan planning agencies, and federal, state, and municipal service delivery regions. CT Gen Stat § 16a-4c (2012).

limits used in affordable, assisted, and public housing programs in Connecticut and nationwide

- Eight counties, although most of their governmental functions were abolished in 1960
- Four Metropolitan Statistical Areas and one Micropolitan Statistical Area (“MSA”) used by the U.S. Census Bureau for reporting data, whose delineation corresponds to either a county or one group of three counties
- 26 Public Use Microdata Areas (“PUMAs”) defined by the U.S. Census Bureau for disseminating Public Use Microdata Sample (“PUMS”) data, comprising either an entire county or from two to seven municipalities in a county depending upon population size
- Nine Labor Market Areas, delineated by the U.S. Department of Labor, Bureau of Labor Statistics, are combinations of municipalities, largely based on commuting flows, for the purpose of compiling, reporting, and analyzing data on employment, unemployment, and workforce availability<sup>39</sup>

The nine RCOGs and their planning regions are well-established and well-recognized in Connecticut planning law and practice. Originally established in 1971, the RCOGs bring together municipalities to address common concerns, coordinate land use and transportation planning on a regional basis, organize shared services, conduct regional planning, and collect, disseminate and analyze data pertaining to each region. Significantly, Connecticut’s zoning enabling law requires municipal zoning regulations to

“...encourage the development of housing opportunities, including opportunities for multifamily housing, consistent with soil types, terrain and infrastructure capacity, for all residents of the municipality and the **planning region** in which the municipality is located ...” [emphasis added]<sup>40</sup>

RCOG planning regions are all agglomerations of towns, so that data available on a municipal basis can be aggregated at a regional level. All of the key data sets used in this fair

---

<sup>39</sup> As defined by the Bureau of Labor Statistics, “...a LMA is an economically integrated geographic area within which individuals can reside and find employment within a reasonable distance or can readily change employment without changing their place of residence.” U.S. Department of Labor, Bureau of Labor Statistics, Web site, <https://www.bls.gov/lau/lauggeo.htm> <accessed April 21, 2020>

<sup>40</sup> CT Gen Stat § 8-2.

share model, including (a) estimates of lower income households that are cost-burdened, (b) population projections, and (c) population and household counts and estimates, are available at the town level and can easily be aggregated for each RCOG planning region.

The HUD Metro FMR Areas are a critical building block in any fair share housing methodology, as they provide the basis, standard across the United States, for establishing the income limits used to define lower income households. However, the eleven HMFAs do not coincide with the nine RCOGs and have no grounding in Connecticut planning law.

The U.S. Census Bureau reports key data sets in this fair share methodology on a county basis. Also, this fair share model relies in part on population projections, which are inherently more reliable for larger geographic areas, such as counties compared with municipalities, as the larger population base of a county will be less susceptible to short term variations and exogenous events. However, county government in Connecticut no longer exists and has no role in Connecticut planning law and practice.

The Census Bureau's MSAs are important geographies for statistical reporting and providing a metropolitan perspective, while its PUMAs are important for consistent sampling purposes, but neither has any particular linkage with Connecticut planning law or regional planning practice. Also, some of the MSAs encompass Connecticut counties as well as parts of other adjacent states.

Similarly, the Labor Market Areas are important geographies for statistical reporting and economic analysis, but have no linkage with Connecticut planning law.

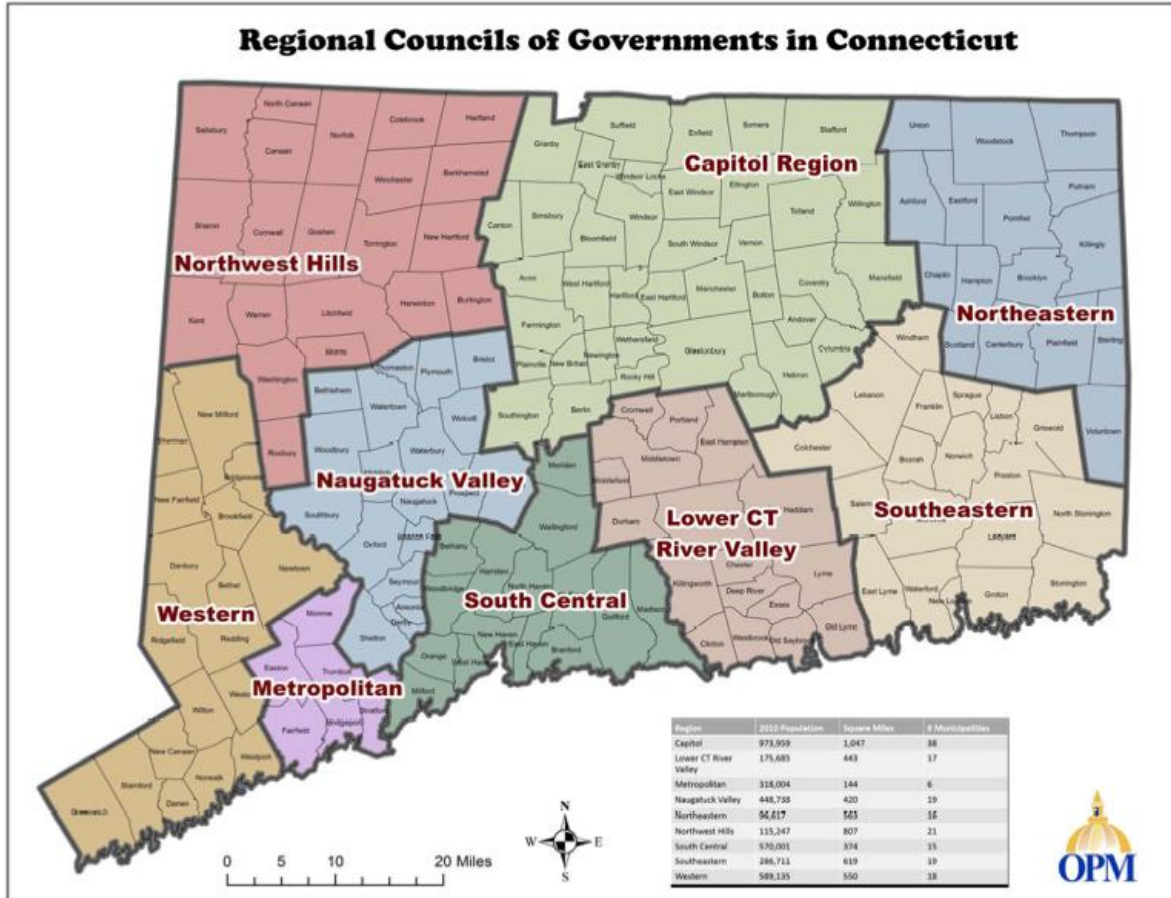

Consequently, this methodology adopts the nine RCOG planning regions as the "Housing Regions" for this fair share model, principally because they meet three important criteria:

- The State of Connecticut has delineated these regions under State law for regional planning purposes
- The RCOG planning region boundaries coincide with municipal boundaries that are important due to the availability of key data at the municipal level

- The RCOG planning regions are an integral component of Connecticut’s land use planning system<sup>41</sup>

Figure 5 maps these Housing Regions.

Figure 5: Connecticut Housing Regions

Source: Connecticut Office of Policy and Management, Web site, <https://portal.ct.gov/OPM/IGPP-MAIN/Responsible-Growth/Regional-Planning-Organizations-RPO> <accessed April 21, 2020>

## Step 2: Calculate Regional Current Need (Fair Share), 2020

<sup>41</sup> Each RCOG is charged with prepared a regional plan of conservation and development, which must be considered by each municipality in the region when it prepares its municipal plan of conservation and development at least once every ten years. CT Gen Stat § 8-23(d).

This fair share methodology defines Current Need as the number of existing extremely low income households (household income <30% of median income) in Connecticut and its Housing Regions in 2020 who are severely cost-burdened (spend >50% of income for housing costs).

HUD calculates this component of affordable housing need, from time-to-time, for states, counties, and “minor civil divisions” (“MCD”), which are towns in Connecticut, based on custom tabulations of American Community Survey data from the U.S. Census Bureau. As HUD explains,

“These data, known as the “CHAS” data (Comprehensive Housing Affordability Strategy), demonstrate the extent of housing problems and housing needs, particularly for low income households.”<sup>42</sup>

These federal data are the basis for calculating Current Need by Housing Region, as shown in Figure 6. While the most recent CHAS data, released by HUD on August 5, 2019, are derived from the 2016 ACS 5-Year and 2017 ACS 1-Year,<sup>43</sup> Current Need in this methodology is referred to as of 2020, as the HUD CHAS calculations are the best available and most recent data.

The Current Need of each Housing Region is the aggregate of the HUD calculations by town of the extremely low-income households who are severely cost-burdened by town in each region.

Western CT	211,685	73,293	21,350
Connecticut	1,346,410	570,792	137,754

Notes

1. Current Need = Extremely Low Income Households (income <30% HAMFI) with Severe Cost Burden (spending for housing >50% of income)
2. The statewide total of Current Need is the aggregate of data for 169 towns and differs by 1.4% (2,014 units) from the statewide estimate of the U.S. Census Bureau presented in Figure 2

Sources:

HUD, Consolidated Planning/CHAS Data by Towns for 2012-2016, released August 5, 2019, <https://www.huduser.gov/portal/datasets/cp.html> <accessed November 6, 2019>

OCA Fair Share Model, Tab Current Need

Prepared by David N. Kinsey, PhD, FAICP, August 20, 2020

The statewide total of Regional Current Need (Fair Share) of 137,754 needed affordable housing units computed by this fair share methodology must be considered in the context of the overall need for affordable housing in Connecticut.<sup>44</sup> Figure 4 above on page 19 charts the key comparisons that are important to recall:

<sup>44</sup> Note that the statewide total of Current Need is 2,014 households (units), based on aggregated town-level data, is greater than the total of 135,740 households calculated by HUD CHAS statewide data. See

- Connecticut today (2020) has about 1.3 million households
- Connecticut today (2020) has about 0.37 million lower income households (<80% AMI) that pay more than 30% of their income for housing costs (cost-burden)
- The computed Current Need of 137,754 housing units by this methodology represents about one-third (36.6%) of current lower income households in need of affordable housing today (2020)

This intentional undercount of housing need, by almost-two thirds, results from a policy choice by Open Communities Alliance and conceptual and data choices in developing this fair share model. In an effort to be fair and use the best available, most up-to-date, and reliable data, this methodology relies on two key assumptions, deemed reasonable in the context of this significant intentional undercount of need and the representation that the Fair Share calculated is only intended as a proxy for quantifying some of Connecticut's affordable housing needs. These assumptions are:

- RCOG regions are the most appropriate "Housing Regions" for this methodology
- HUD calculations, released in August 2019, of extremely low income, severely cost-burdened households by town are a reasonable proxy for current (2020) Current Need, albeit based on 2016 ACS 5-Year data

Now that the regional assessments of housing need have been completed, the next phase of this fair share methodology is to allocate fairly each Housing Region's Regional Current Need (Fair Share) to each town in each Housing Region.

---

Footnote 25.

PHASE TWO:  
ALLOCATE REGIONAL CURRENT NEED TO EACH HOUSING REGION'S TOWNS

In the second phase of this fair share methodology, each Housing Region's Current Need is allocated fairly to the towns in the Housing Region. The methodology uses four allocation factors, which are measures of a town's comparative responsibility and capacity for accommodating affordable housing, compared with other towns in the same Housing Region.

The four factors are:

- Equalized ratables, 2018
- Household income difference, 2018
- Poverty, 2018
- Multifamily housing, 2018

For each allocation factor, the methodology calculates the total regional value of each factor and each town's percentage, or share, of the regional total of the factor. Stated differently, the value of each allocation factor for each town is divided by the regional total for each allocation factor. The four resulting numbers, expressed as decimals, are averaged and then multiplied by the Housing Region's Regional Current Need to yield each town's Gross Fair Share of the Regional Current Need. All four allocation factors are weighted equally and averaged in allocating Regional Current Need among each Housing Region's towns. The rationale for the allocation factors and the data used to allocate Regional Current Need are identified below in the description of each allocation factor.

### **Step 3 Calculate the Ratables Allocation Factor**

The capacity of a town to accommodate its Fair Share depends in part on its fiscal resources available to support vital local services. The ratables factor uses annual data from the Grand List, the aggregate valuation of taxable property in a town, also known as “ratables,” which is available from the CT Office of Policy and Management<sup>45</sup> and the CT Open Data Portal.<sup>46</sup> For a fair comparison of ratables among towns, this methodology uses only equalized valuations, which are available for four property types: (a) residential, (b) apartment, (c) commercial/industrial/public utility, and (d) vacant land. The most recent available equalized data is the Equalized Net Grand List by Town, 2018, maintained by the CT Office of Policy and Management, which is the data source used in this methodology.

This methodology calculates this allocation factor by first adding the equalized valuations by town by Housing Region for four property types: (a) residential, (b) apartment, (c) commercial/industrial/public utility, and (d) vacant land. Second, each town’s equalized valuation is divided by the region’s total equalized valuation. The resulting ratio or percentage is the town’s Ratables Allocation Factor, its share of the region’s ratables.

### **Step 4 Calculate the Household Income Difference Allocation Factor**

The capacity of a town to accommodate its Fair Share also depends in part on the financial resources of its resident taxpayers and their ability to provide the fiscal resources necessary to support vital local services. Some towns in a region are more affluent than others. To identify the extent of these differences in household income among a region’s towns, this methodology averages two measures of median household income by town by region:

---

<sup>45</sup> CT Office of Policy and Management, “Total Grand Lists by Town,” Website, <accessed May 27, 2020>, <https://portal.ct.gov/OPM/IGPP-MAIN/Publications/Total-Grand-List-by-Town>

<sup>46</sup> CT Data Website, <https://data.ct.gov/browse?q=Net+Grand+List+by+Town>, <accessed May 27, 2020>

Income Measure No. 1:

Municipal share of the regional sum of the differences between median household income and an income floor (\$100 below the lowest municipal median household income in the region) and

Income Measure No. 2:

Municipal share of the regional sum of the differences between median municipal household incomes and an income floor (\$100 below the lowest municipal median household income in the region) weighted by the number of households (occupied housing units) in the municipality.

The result is each town's share or percentage of the regional household income differences.

The most recent data on median household income and number of households by town are from the 2018 ACS 5-Year (Table S1901). This data for all towns is used in this methodology to calculate municipal shares (percentages) of differences in regional household incomes, i.e., the Household Income Difference Allocation Factor.

## **Step 5 Calculate the Poverty Allocation Factor**

Connecticut law directs municipal zoning regulations to "...promote ... economic diversity in housing, including housing for both low- and moderate-income households,"<sup>47</sup> yet some towns, compared with peers in their Housing Region, lack economic diversity. One readily available metric of economic diversity is the poverty rate by town, calculated by the U.S. Census Bureau. The poverty rate in this context is the percentage of a town's total population that is below the poverty threshold calculated annually by the U.S. Census Bureau.<sup>48</sup> Towns with a low poverty

---

<sup>47</sup> CT Gen Stat §8-2.

<sup>48</sup> U.S. Census Bureau, "How the Census Bureau Measures Poverty," Website, <https://www.census.gov/topics/income-poverty/poverty/guidance/poverty-measures.html> <accessed June 30, 2020> Note that the U.S. Census Bureau calculates the "poverty rate" based on the "Total Population for Whom Poverty Status Is Determined," which is fewer people in many towns than the total population estimated by its ACS. This fair share methodology calculates this Poverty Allocation Factor based on the total population by town to more accurately compare the differences in the extent of poverty among a region's towns.

rate and a high percentage of their population with incomes above the federal poverty threshold are not as economically diverse as towns with more moderate percentages of their population above the poverty threshold. This methodology establishes a higher poverty rate allocation factor for towns that have a lower poverty rate, compared with their regional peers.

The most recent data on the population by town with incomes below the poverty threshold, as defined by the U.S. Census Bureau, is 2018 ACS 5-Year (Table B17001).<sup>49</sup> This data for all towns is used in this methodology to calculate a town's share of the regional sum of the towns' percentages of population at or above the federal poverty threshold, the Poverty Allocation Factor.

## Step 6 Calculate the Multifamily Housing Allocation Factor

Connecticut law directs municipal zoning regulations to

“...encourage opportunities for multifamily dwellings, ... promote housing choice... and encourage the development of housing which will meet the housing needs identified in ... the housing component and the other components of the state plan of conservation and development prepared pursuant to section 16a-26.”<sup>50</sup>

The current “state plan of conservation and development,” entitled *Conservation & Development Policies for Connecticut, 2013-2018*, and its successor, *Conservation & Development Policies for Connecticut, 2018-2023*, Revised Draft, contains an identical Growth Management Principle #2:

“Expand housing opportunities and design choices to accommodate a variety of household types and needs.”<sup>51</sup>

---

<sup>49</sup> For 2018, the U.S. Census Bureau defined the poverty threshold for a four-person household of two adults and two children at an annual income of \$25,701. U.S. Census Bureau, “Poverty Thresholds,” Website,

<https://www.census.gov/data/tables/time-series/demo/income-poverty/historical-poverty-thresholds.html>

<sup>50</sup> CT Gen Stat §8-2.

<sup>51</sup> CT Office of Policy and Management, *Conservation & Development Policies for Connecticut, 2013-2018*, adopted June 5, 2013, page 12, and *Conservation & Development Policies for Connecticut, 2018-2023*, Revised Draft [no date, under consideration by the General Assembly in the 2020 legislative session], page 9, Website, <https://portal.ct.gov/OPM/IGPP-MAIN/Responsible-Growth/Conservation-and-Development-Policies-Plan/Conservation-and-Development-Policies-Plan>, <accessed May 27, 2020>

One readily available metric of the extent of “opportunities for multifamily dwellings” and the extent of “variety of housing types” that have been accommodated in compliance with this Growth Management Principle is the share of a town’s housing stock that are multifamily housing units compared with other towns in the same region. The most recent data on existing multifamily housing units (2 or more units in a structure) by town, as defined by the U.S. Census Bureau,<sup>52</sup> is 2018 ACS 5-Year (Table B25032). This data for all towns is used in this methodology to calculate a town’s share of the regional sum of the towns’ multifamily housing units as percentages of total occupied housing units by region, the Multifamily Housing Allocation Factor.

#### **Step 7 Calculate the Average Allocation Factor by Town**

Next, the four allocation factors calculated in Step 3 through Step 6 are averaged by town to calculate the Average Allocation Factor by town.

#### **Step 8 Calculate the Gross Fair Share by Town**

Multiplying the Regional Current Need by a town’s Average Allocation Factor yields a town’s allocated Gross Fair Share of the Regional Current Need, i.e., needed new housing units affordable to lower income households.

In this manner, the statewide need of 137,754 affordable housing units calculated in Step 2 is allocated fairly, by Housing Region, initially to all 169 towns.

---

<sup>52</sup> U.S. Census Bureau, American Housing Survey for the United States, 2017, Appendix A. Subject Definitions and Table Index, <https://www2.census.gov/programs-surveys/ahs/2017/2017%20AHS%20Definitions.pdf> <accessed June 30., 2020>

## Step 9 Screen High Poverty Towns

The uneven distribution of affordable housing among Connecticut's towns, coupled with decades of exclusionary zoning and other exclusionary policies and practices, has resulted in the state's poor being concentrated in a small percentage of its 169 towns. For example, 42.8% of Connecticut's total poverty population live in only seven towns, which have only 17.7% of the state's total population. These seven towns, in descending rank of percent of total population in poverty, are: Hartford, New London, New Haven, Waterbury, Windham, New Britain, and Bridgeport. According to the most recent data from the U.S. Census Bureau, in 2018 a total of 348,449 persons in Connecticut lived in households below the poverty threshold, for a statewide average poverty rate of 9.73% of the total population.<sup>53</sup>

To limit a further concentration of poverty, and of affordable housing,<sup>54</sup> this fair share methodology screens out the seven highest-ranked "High Poverty" towns, defined as towns with poverty rates greater than 20%, which is significantly higher than the statewide average of 9.73%, and significantly higher than the eighth-ranked town, by a difference of 2.43%. This screening out results in these seven towns having an Average Allocation Factor Post Poverty Rank Screening of zero (0.0) in the Model.

---

<sup>53</sup> U.S. Census Bureau, 2018 ACS 5-Year, Table B17001 and Table B09019. Note that the Census Bureau ACS estimates by town the "Total Population for Whom Poverty Status is Determined," while this fair share methodology uses that data to calculate the percentage of the total population of a town that is below the poverty level.

<sup>54</sup> Connecticut has eight towns where more than 20% of the housing is counted as affordable housing under the Affordable Housing Land Use Appeals Act, CT Gen Stat 8-30g. Connecticut State Department of Housing, 2019 Affordable Housing Appeals List <https://portal.ct.gov/-/media/DOH/2019-Appeals-List-for-online.pdf> <accessed September 14, 2020> In six of the seven towns identified in this fair share methodology as High Poverty more than 20% of the housing stock is affordable housing.

**Step 10 Identify the Average Allocation Factor Post Screening High Poverty Towns**

Next, the Average Allocation Factor Post Screening High Poverty Towns is identified in a binary choice. It is either the Average Allocation Factor initially calculated in Step 7 for Housing Regions or zero for the seven High Poverty towns.

**Step 11 Reallocate High Poverty Towns' Gross Fair Share by Calculating the Reallocated Average Allocation Factor Post Poverty Rank Screening**

The Gross Fair Shares of the seven High Poverty towns, totaling 6,342 units or 4.6% of the total statewide, do not disappear in the Model. Instead, these Gross Fair Shares are pooled and reallocated within each of the five Housing Regions that host one or more of the High Poverty towns. This reallocation takes place in the calculation of the Reallocated Average Allocation Factor Post Poverty Rank Screening. For each town, its Average Allocation Factor Post Poverty Rank Screening, calculated in Step 10, is divided by the sum of its Housing Region's total of Average Allocation Factors Post Poverty Rank Screening, to yield its Reallocated Average Allocation Factor Post Poverty Rank Screening.

**Step 12 Calculate the Gross Fair Share by Town Post High Poverty Town Screening**

Next, the Gross Municipal Fair Share is recalculated for the towns in a Housing Region with one or more of the High Poverty Towns, by multiplying the Regional Fair Share calculated in Step 2 by the Reallocated Average Allocation Factor Post Poverty Rank Screening calculated in Step 11. For Housing Regions with no High Poverty Towns, there is no change in the Gross Municipal Fair Share.

### **Step 13 Calculate Transition Adjustment Factor**

Towns should prepare, propose for public scrutiny and input, adopt, implement, and periodically review, update, and amend municipal plans to satisfy their Fair Share through zoning changes, new construction of affordable housing, and other mechanisms. As Connecticut's current affordable housing crisis and segregated landscape has developed over decades, the Municipal Fair Share is viewed generally as a ten-year goal, but some towns may need more time to take the steps necessary to accommodate their Fair Share responsibility.

To that end, this fair share methodology provides for a Transition Adjustment Factor, defined as 20% of the occupied housing in a town, as a ceiling for fair share units allocated to a municipality for an initial ten-year implementation-compliance period. The Model adjusts the Fair Share for the first decade, for 2020-2030, to the level of the Transition Adjustment Factor. Connecticut's housing needs should be reassessed and Fair Share responsibilities reallocated based on updated data before the end of the first decade.

### **Step 14 Calculate the Fair Share by Town**

The final step in this fair share methodology is to calculate the Fair Share of all towns. For the seven highest ranking towns by % poverty population, there is no allocation, to avoid a further concentration of poverty. For the 48 towns that qualify for the Transition Adjustment Factor, the Fair Share is the Gross Fair Share Post Poverty Rank Screening adjusted downward to the level of the calculated Transition Adjustment Factor. For the remaining 114 towns, the Fair Share is either the Gross Fair Share or, if in a Housing Region with one of more of the seven High Poverty towns, the Gross Fair Share Post Poverty Rank Screening.

The statewide total of the Fair Share of towns, allocated on a regional basis, pooled and reallocated after screening out High Poverty towns, and adjusted using a Transition Adjustment Factor, is 121,085 affordable housing units.

CONCLUSION

This Open Communities Alliance Fair Share Model for Connecticut assesses affordable housing need realistically and pragmatically by Housing Region, and then allocates fairly that need to all towns in each Housing Region. After screening out High Poverty Towns, reallocating their Fair Shares, and applying a Transition Adjustment Factor, the Model results in a statewide total allocated and adjusted Fair Share of 121,085 affordable housing units as of 2020. Figure 7 presents these allocations by Housing Region:

Figure 7: Connecticut Fair Share Allocations by Housing Region, 2020

Connecticut Fair Share Allocations by Housing Region, 2020		
Housing Region	Gross Regional Fair Share (units)	Regional Fair Share, Post Poverty Rank Screening, Reallocation, and Transition Adjustment Factor (affordable housing units )
Capital	36,498	33,844
Lower CT River Valley	5,283	5,251
Metropolitan	14,465	11,061
Naugatuck Valley	17,822	16,265
Northeast CT	2,750	2,669
Northwest Hills	3,498	3,396
South Central CT	25,889	20,843
Southeastern	10,200	8,934
Western CT	21,350	18,822
CONNECTICUT	137,754	121,085

Appendix A presents the Fair Share for each of the 169 towns in Connecticut, alphabetically and by Housing Region. Across the state, the Fair Share of towns, not including

the High Poverty Towns, ranges from 97 affordable housing units for North Canaan to 4,300 affordable housing units for Fairfield.

As updated data on population, estimated households, lower income households, cost-burdened households, household income, poverty, ratables, multifamily housing, and other inputs to the Model become available, the Model can be easily updated. The Model and all the data used in the calculations of Fair Share are available in an Excel workbook at this [link](https://www.ctoca.org/fairshare) [<https://www.ctoca.org/fairshare>].

APPENDIX A: FAIR SHARE HOUSING ALLOCATIONS BY TOWN, 2020  
(alphabetically and by Housing Region)

Summary of Connecticut Fair Share Housing Allocations by Towns, 2020 (affordable housing units)

by Housing Regions		
Town	Gross Municipal Fair Share	Fair Share
<b>Capitol Region</b>		
Andover	776	236
Avon	1,274	1,274
Berlin	1,104	1,104
